

Companion Planting Chart

What to grow together — and what to avoid

Companion planting means growing certain plants near each other for a real, practical benefit — better pest control, improved growth, or more efficient use of garden space. The chart below covers ten common vegetables and herbs: what grows well with each one, and what to keep apart. Companion planting isn't an exact science, so treat this as reliable general guidance rather than a strict rulebook for your specific garden.

Plant	Type	Good Companions	Avoid Planting With
Tomatoes	Vegetable	Basil, Onions, Chives	Kale, Dill
Peppers	Vegetable	Basil, Onions	—
Cucumbers	Vegetable	Beans, Dill	—
Onions	Vegetable	Tomatoes, Peppers, Kale	Beans
Kale	Vegetable	Onions, Dill, Chives	Tomatoes
Beans	Vegetable	Cucumbers	Onions, Chives
Basil	Herb	Tomatoes, Peppers	Mint
Mint	Herb	—	Basil, Dill, Chives
Dill	Herb	Kale, Cucumbers	Tomatoes, Mint
Chives	Herb	Tomatoes, Kale	Beans, Mint

Companion Planting for Pest Control

- **Marigolds** (especially French marigolds) release compounds from their roots that suppress root-knot nematodes — plant them as a border around vegetable beds.
- **Dill and chives** attract predatory and parasitic insects (ladybugs, lacewings, parasitic wasps) that prey on aphids and caterpillars.
- **Mint** should always be grown in a buried pot, never directly in the bed — it spreads aggressively and will crowd out neighboring herbs within a season.
